

Chapter 2 Exercises

This folder contains:

basic.html

cursors.html

Directions:

basic.html is used with the 2 exercises on pp. 27-30 and with the exercise on p. 34. Follow the directions within the book.

Directions:

cursors.html refers to the information on pp. 31-32. Your task is to apply the appropriate value to the cursor property for the word within that specific table cell. Open the code and you will see an example for the first cell within the first row of the table.

You are allowed to use inline styles for this exercise. This will give a chance for you to become familiar with inline styles should you not know how to write inline style code. Inline styles cannot be used for other tasks (i.e., exercise, assignments) unless specifically stated you can use inline styles within the directions. If you have questions contact the Instructor.

Note: Normally you would no longer use inline styles when creating a web page. That said, you do need to know about inline styles for styling HTML within an email message and may see it when updating HTML code. Being familiar with the code is important for those reasons. In this class you will not be allowed to use inline styles unless specifically stated otherwise in the directions.
